

Enthium

The base layer, in English. Hold a home-row key for the modifier on its lower edge, or a thumb key for the layer named on it. The display shows ENTH.

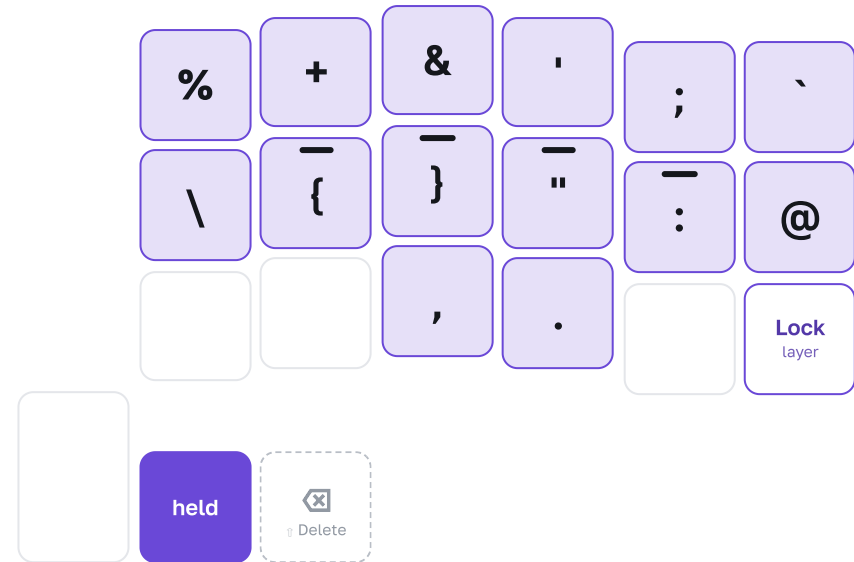

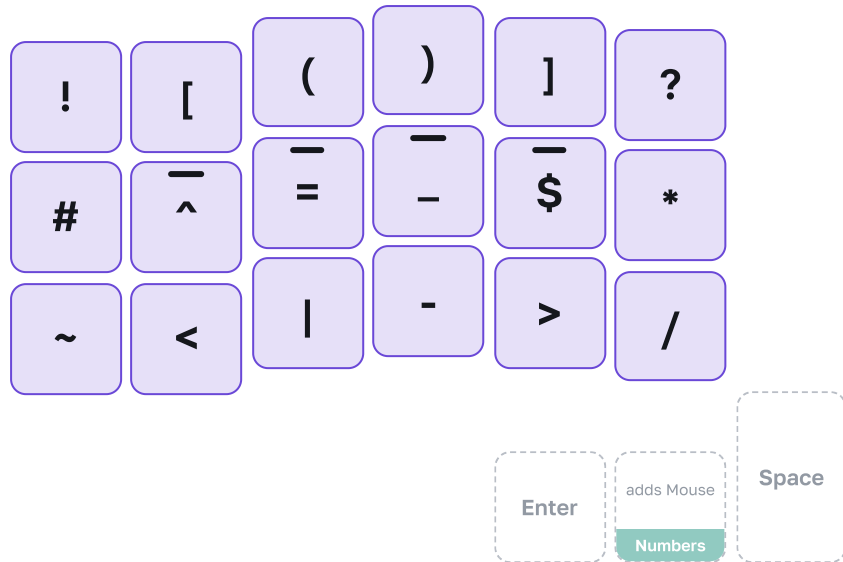

Русский

On whenever the system layout is Russian. Shortcuts with Control, Option or Command use the Enthium keys, so they stay under the same fingers. Ъ is on the R thumb. The display shows RUS.

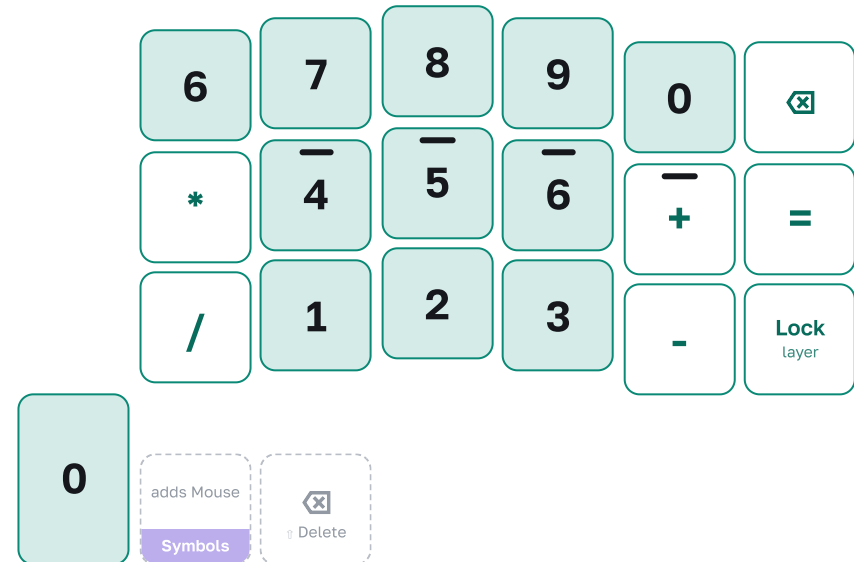

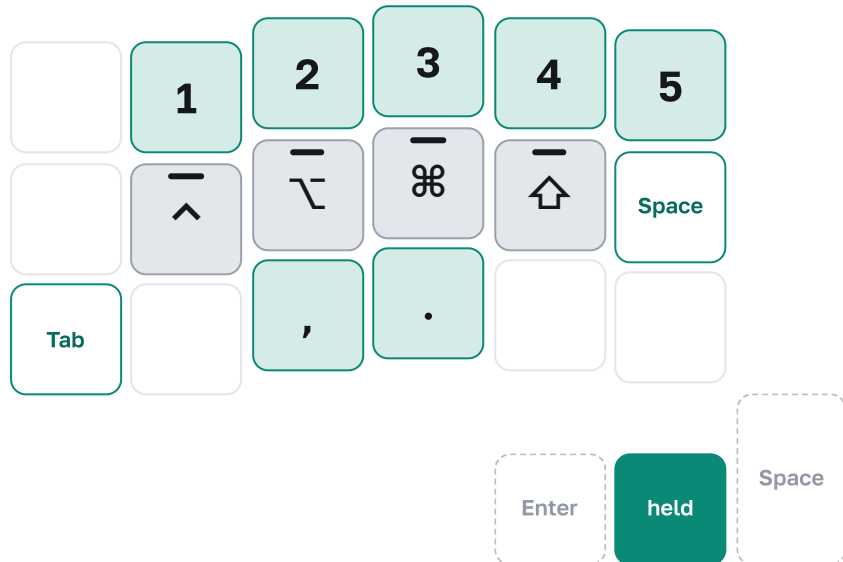

Symbols

Hold the middle key of the right thumb. Brackets and arrows roll inward on the left hand; Space, Enter and Backspace keep working. The display shows SYM.

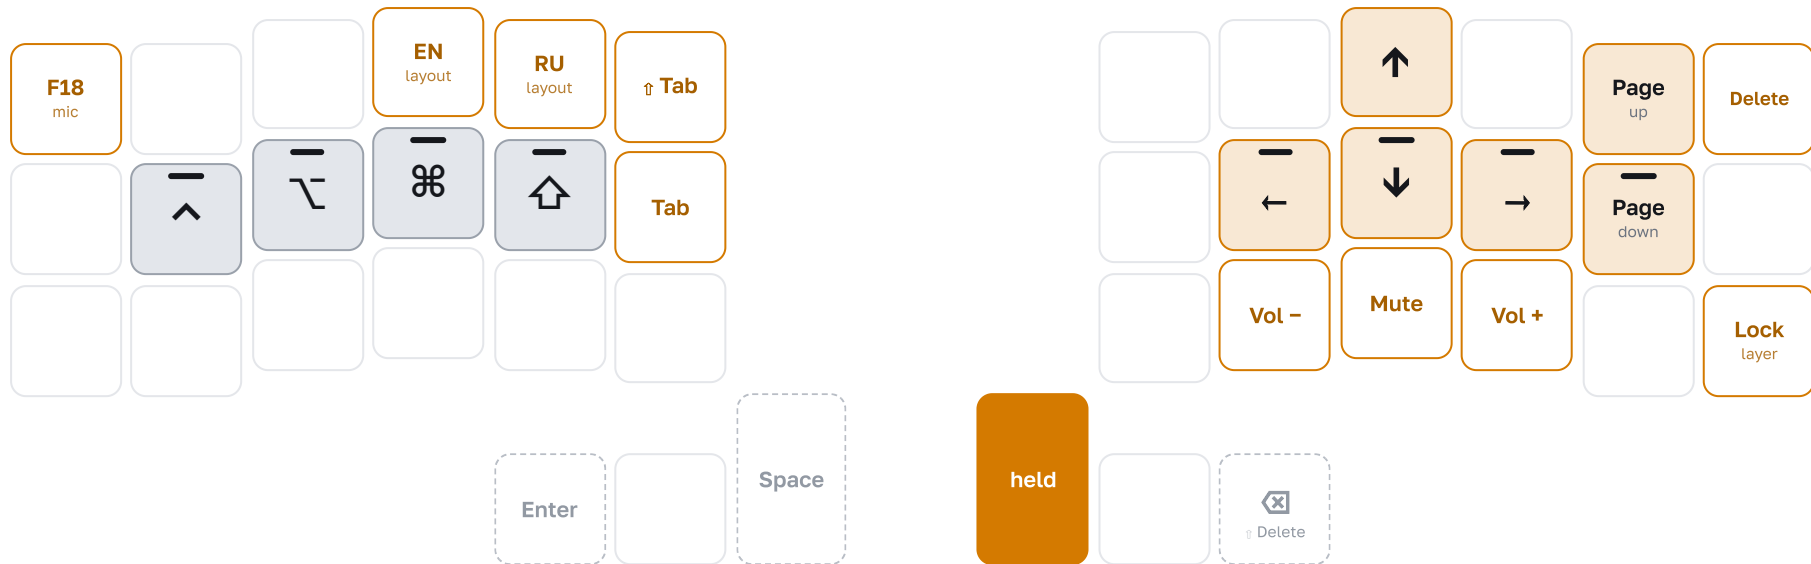

Numbers

Hold the middle key of the left thumb. Digits run along the top row and again as a number pad under the right hand; comma and full stop sit where they are on the base layer. The display shows NUM.

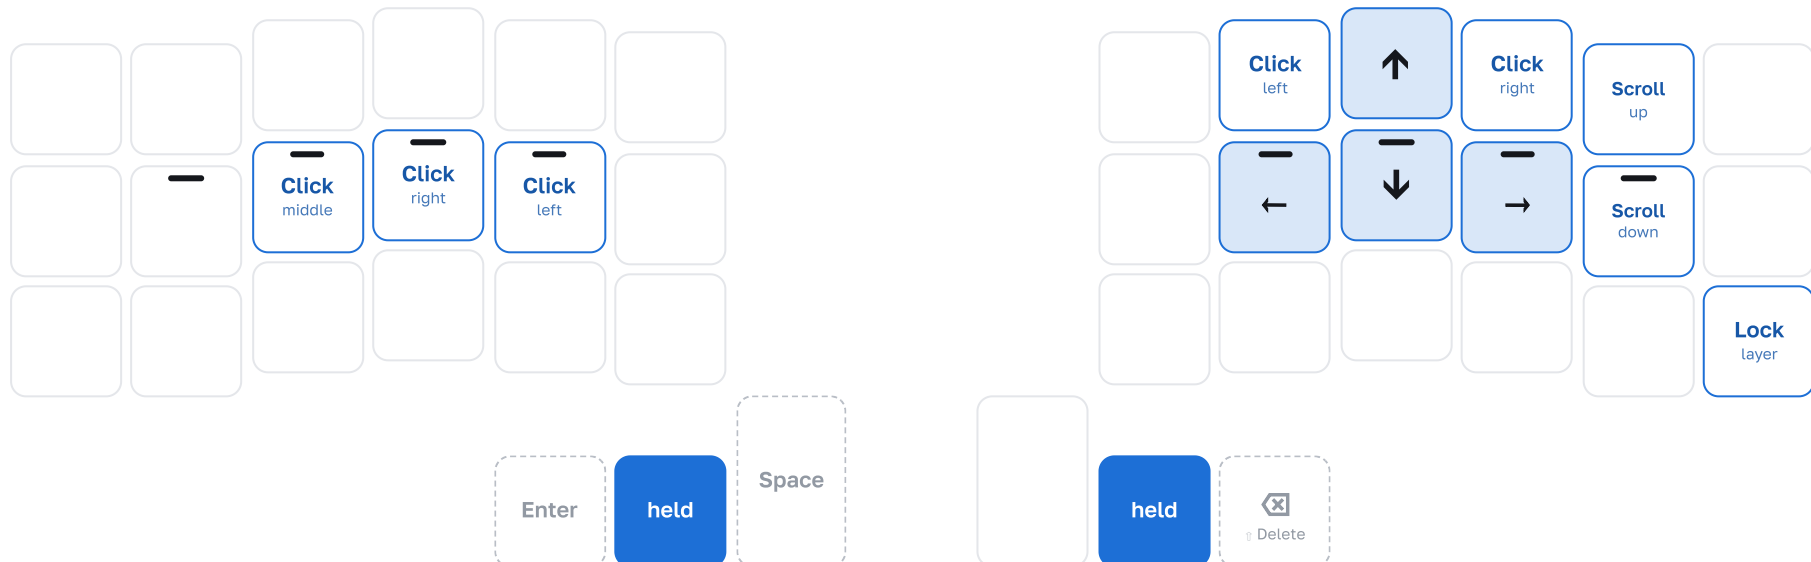

Command

Hold the R key on the right thumb. Arrows and paging under the right hand, layout switching and modifiers under the left. The display shows CMD.

Mouse

Hold both middle thumb keys, Numbers and Symbols together. The right hand moves the pointer; the left home row clicks, so you can hold a button and drag. The display shows MOUS.

Between the layers

Pressed together

h	t	Escape	
h	t	n	Escape, then English
u	-	English layout	
l	k	Russian layout	

The same four positions work in Russian.

Shift tricks

⇧	⇧	Caps Word: capitals until the word ends, in either layout
⇧	⌫	Delete

Layouts

The keyboard follows the system layout, however you switch it. Its own EN and RU keys send Caps Lock and Shift + Caps Lock.

In Russian, holding Symbols switches the system to English for as long as you hold it, so every symbol comes out the same in both layouts.

Symbol rolls

Roll inward on the left hand, pinky towards index:

()	[]	<>	->	=>	<-
!=	<=	>	~/	!()	

Slide one finger along its column:

/*	*/	#!
----	----	----

Braces and quotes are on the right hand, so \${{}{" alternate hands.

Staying on a layer

While holding a layer key, tap Lock (bottom right) and let go: the layer stays on. Tap Lock again to leave. Works for Symbols, Numbers, Command and Mouse.

Right display

EN or RU in large type, the name of the layer you hold, and along the bottom the modifiers you hold, lit in finger order from pinky to index.

Home row

Each home key is a letter when tapped and a modifier when held: Control, Option, Command, Shift from pinky to index, mirrored on the right hand. On Linux, Control and the Super key trade places, so Control sits under the middle finger there.

A modifier only takes hold with a key from the other hand, or after a short pause, so fast typing never triggers one by accident.

Reading the keys

a ^	Tap for the letter, hold for the lower edge
- t	Home position, where the fingers rest
7	What the layer is for
+	Extras on the layer
held	The key you are holding
Tab	Same as the base layer
	Does nothing
